BOLD Contrast Advancements

1991- 2

- TE dependence
- Field Strength Dependence
- Resolution Dependence
- Pulse sequence dependence (T2 and T2*)
- Dynamics: latency and return to baseline
- First BOLD models
- Correlation of BOLD with parametric task manipulation
- Post undershoot

1992- 3

- NMR phase shift observation
- Angio and venogram correlation
- Effects of Physiologic Stress

1993- 4

- Retinotopy
- Cognitive mapping
- Event - related fMRI

1994 - 5

- Parametric task design
- Sub-millimeter resolution fMRI
- Diffusion weighting dependence (IV contribution)

1995 - 6

- Physiologic fluctuations

1996 - 7

- Extended duration stimulation effects
- Pre undershoot

1997-

8

- Flow and BOLD comparisons (dynamics and magnitude)
- Blood volume dynamics
- Simultaneous flow and BOLD acquisition
- Ocular Dominance Column Mapping

1998 - 9

- CMRO₂ Mapping
- Randomized ER-fMRI task design
- Balloon Model
- Baseline Blood Oxygenation Quantitation
- Mental Chronometry
- Linearity of BOLD signal change

1999 - 2000

How Much More Information Can we Obtain?

Neuronal Firing Rates

Hemodynamics:

will eventually have quantitative maps of flow, oxygenation, volume, and CMRO₂ as well as other parameters such as velocity, exchange, hematocrit, and vascular responsivity.

Resolution: < 1 mm and < 100 ms.

Key:

Neuronal, Physiologic, and Pulse Sequence Modulation

Needs...

More “embedded information” pulse sequences

More specific neuronal activation and physiologic stresses

Which requires...

Extreme sensitivity (high field strength)

$\Delta R2^* / \Delta R2$

Further Advancements?

More pulse sequence modulation

Model fitting and constraining

Simultaneous collection of multiple types of baseline and time series information

Spatial mapping of dynamic characteristics with well controlled stimuli

High Field Strength:

Ask questions across spatial resolution scales

Ask more subtle questions about dynamics and magnitudes

Reduced intravascular effects

Create MAPS of these effects..

Maps:

Spin-echo vs. gradient-echo

Flow vs. BOLD

Latency

Post undershoot

Pre undershoot

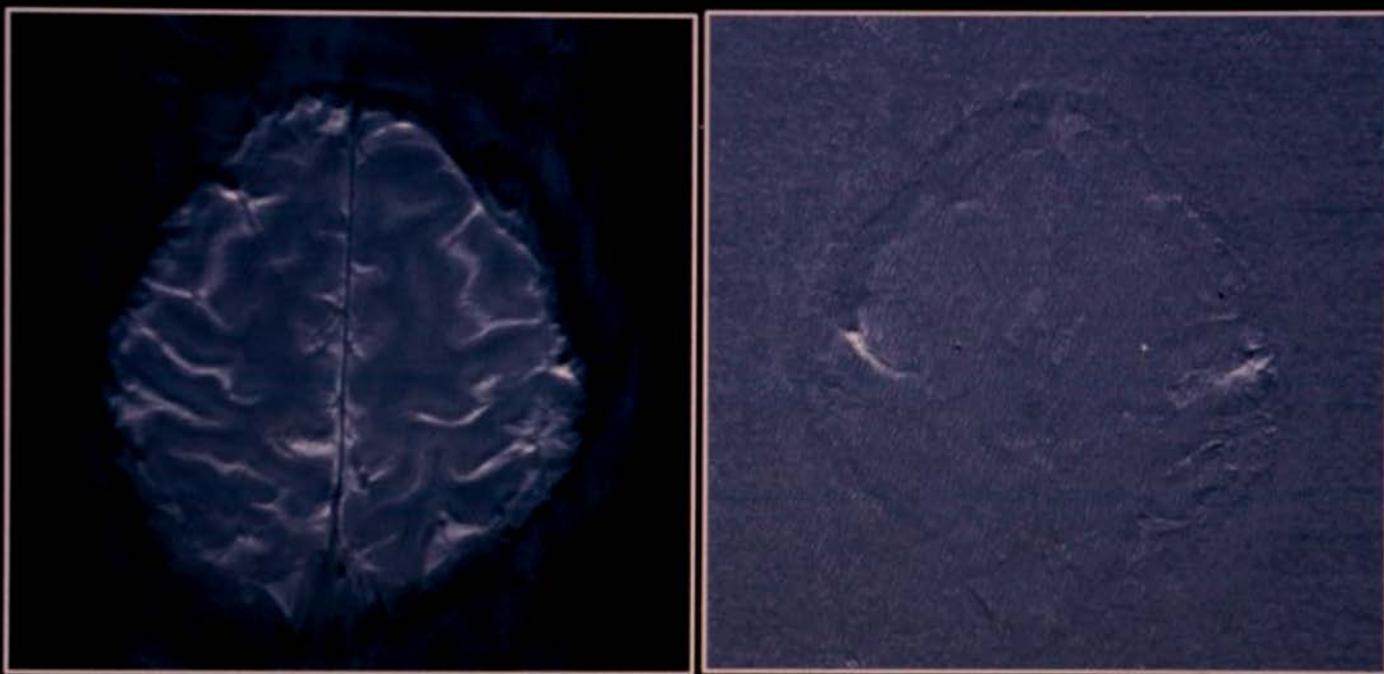

Balloon model parameters

Diffusion attenuation

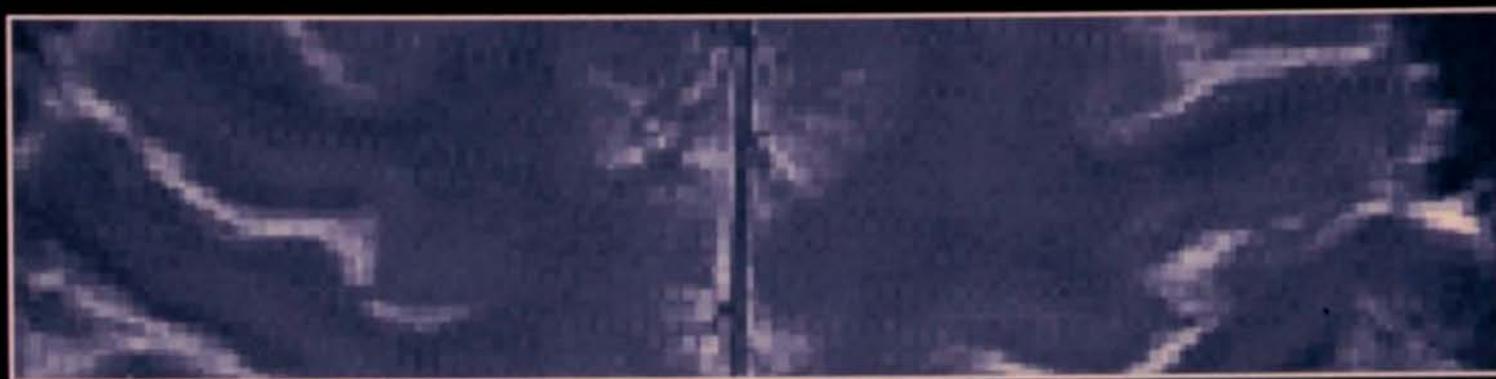

Correlation with parametric task modulation

Noise correlation

(dependent on the T2 of blood)*

Blood T2

- Thulborn et al. Biochim Biophys Acta, 714: 265-270, 1982
- Gomori et al. JCAT, 11: 684-690, 1987
- Wright et al. JMRI, 1: 275-228, 1991
- Ogawa et al. MRM, 29: 205-210, 1993
- Gilles et al. MRM 33: 93-100, 1995
- Brooks et al. JMRI 4: 446-450, 1995
- Meyer et al. MRM 34: 234-241, 1995

Blood T2* ?

Most fMRI is performed using gradient-echo sequences.

Calculating T2* of Fully Oxygenated Blood

Assumption:

T2' of fully oxygenated blood \approx T2' of cortex

T2' of cortex:

$$1/T2' = 1/T2^* - 1/T2 \approx 1/60\text{ ms} - 1/80\text{ ms} \approx 1/240\text{ ms}$$

T2* of fully oxygenated blood (at 1.5T):

$$1/T2^* \approx 1/T2' + 1/T2 \approx 1/240\text{ ms} + 1/250\text{ ms} \approx 1/120\text{ ms}$$

Basic Approach

1. Simplified model based on literature values.

Physiologic:

hematocrit
oxygenation
geometry
susceptibility

MR:

inter-180 time
field strength

3. Adjust *diffusion coefficient* to “match” results of:

• Wright et al. JMRI, 1: 275-228, 1991 (T₂)

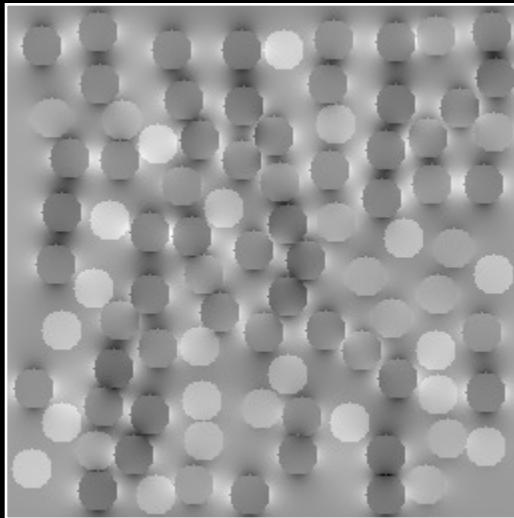

and

• Hoppel et al. MRM, 30: 715-723, 1993 (ΔR_{2*} / ΔR₂)

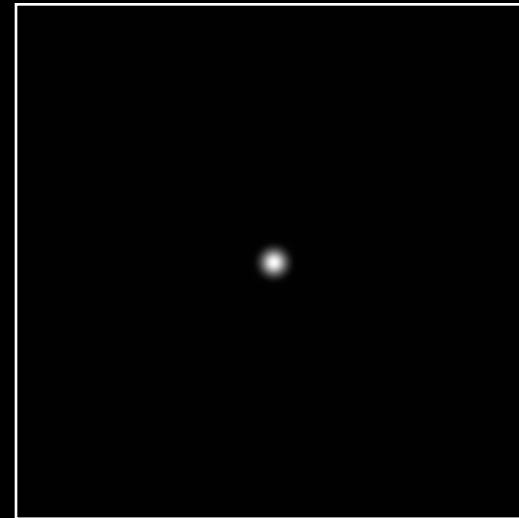

4. Using matched parameters, simulate T_{2*} effects.

Deterministic Diffusion Model

Frequency Offset

Spin Probability Distribution

- Randomly oriented cylinders
- Feely permeable
- Overlapping fields
- Red blood cell radius:
($2.5 \mu\text{m} = 10$ voxels)
- Hct. determines number of cells

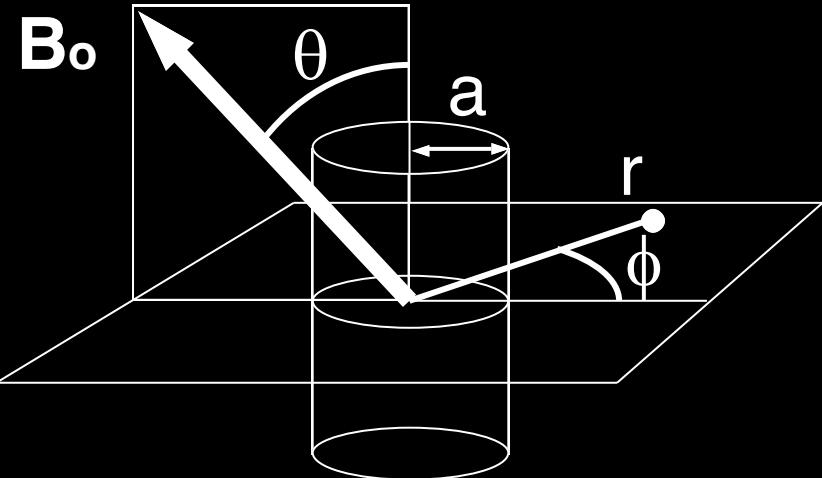

- Gaussian distribution
- Step time increment:
(0.1 ms to 0.25 ms)

$$\text{prob}(x,y) = \frac{(L_x \times L_y)}{2 \pi} \frac{1}{\sigma^2} e^{-\frac{x^2 + y^2}{2\sigma^2}}$$

$$\sigma = \sqrt{2D\Delta t}$$

matrix sizes = 256 x 256 voxels

Frequency Offset Map

$$\Delta\omega' = 2\pi [(42.57 \times 10^6) 2\pi B_o] [\Delta\chi] (1 - Y)$$

rbc
 $\Delta\chi = 0.180 \times 10^{-6}$

$$\Delta\omega (\text{outside}) = \Delta\omega' \sin(\theta)^2 (a/r)^2 \cos(2\phi)$$

$$\Delta\omega (\text{inside}) = \Delta\omega' (3 \cos(\theta) - 1)^2 / 3$$

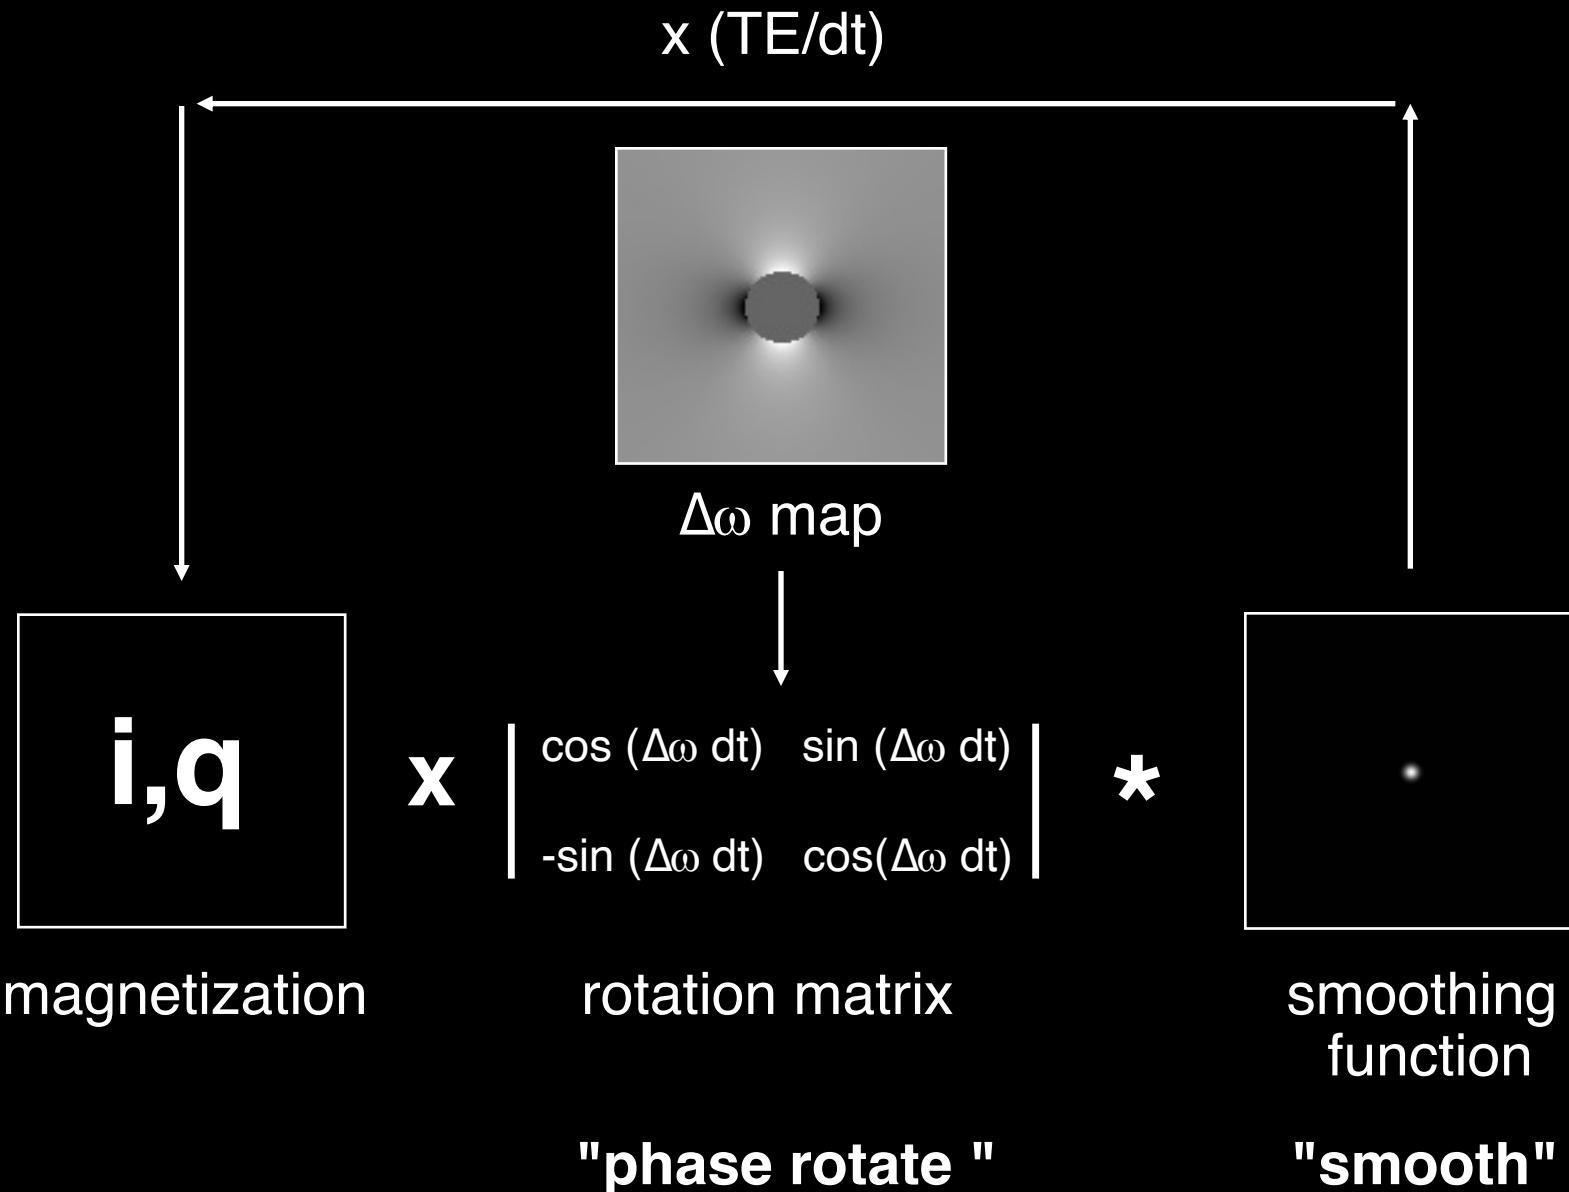

S. Ogawa et al.
Biophys J. 64, 803-812 (1993).

Spin Probability Distribution

$$\text{prob}(x,y) = \left(\frac{L X_x L Y}{2 \pi} \right) \frac{1}{\sigma^2} e^{-\left(\frac{x^2 + y^2}{2 \sigma^2} \right)}$$

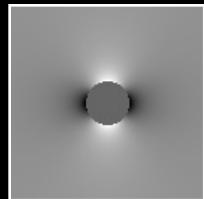

$$\sigma = \sqrt{2 D t}$$

$$D (\text{pixels}^2/\text{ms}) = \frac{D (\mu\text{m}^2/\text{ms})}{\left(\frac{\text{cell radius} (\text{pixels})}{\text{cell radius} (\mu\text{m})} \right)^2}$$

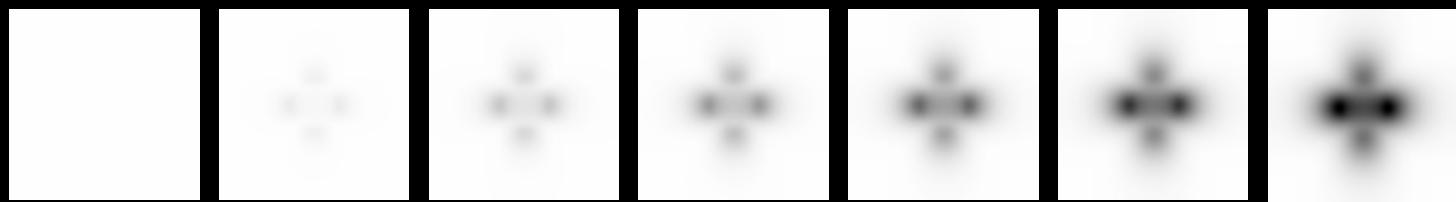

"Phase Rotate" and "Smooth" Simulation

- 1) Start with maps of uniform, coherent transverse magnetization ($i = 1, q = 0$).
- 2) For each time interval, dt , perform:
 - a) Spatially - dependent phase rotation.
(using $\Delta\omega$ maps)
 - b) Convolution with gaussian smoothing function.
(representing diffusion during time, dt)
 - c) Signal magnitude calculation by complex addition of every matrix element.

Spin-Echo

GE

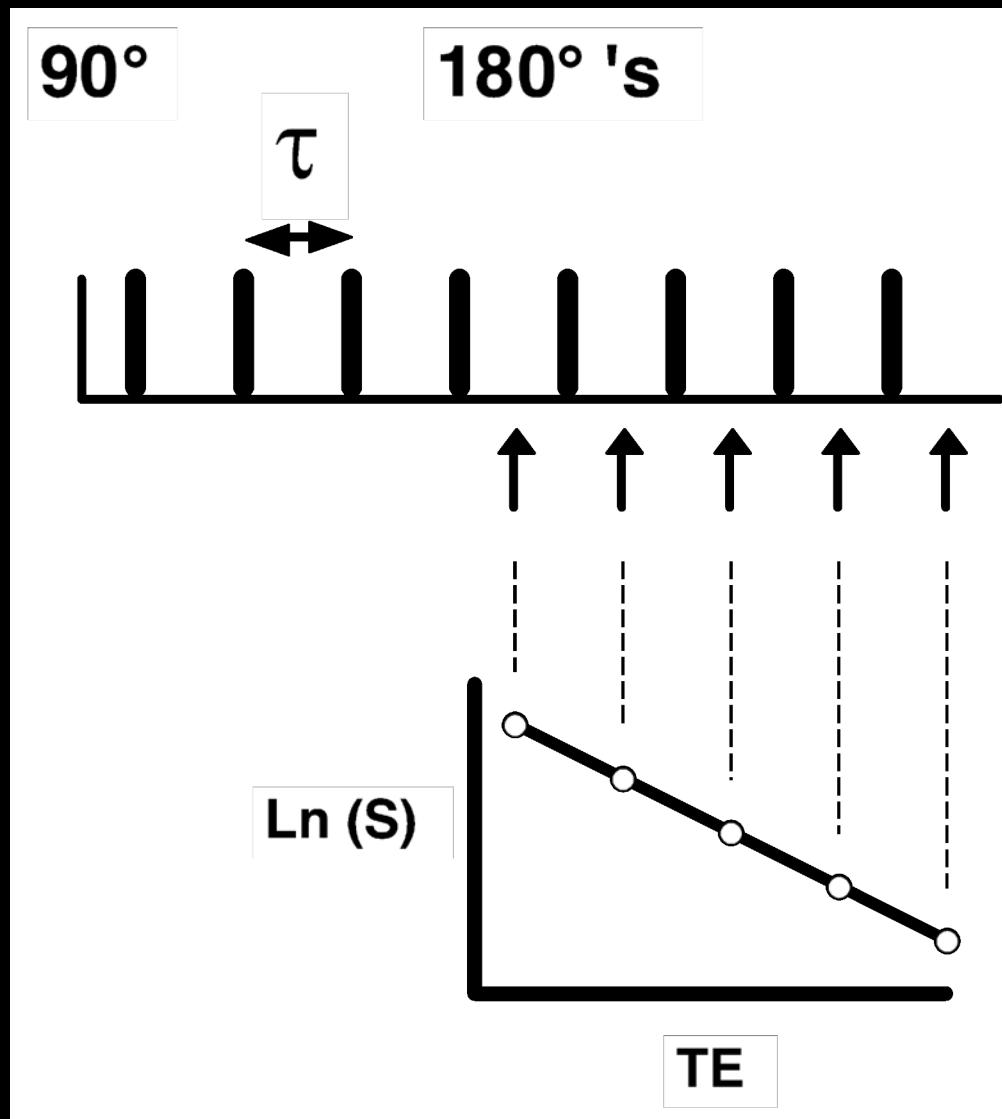

SE

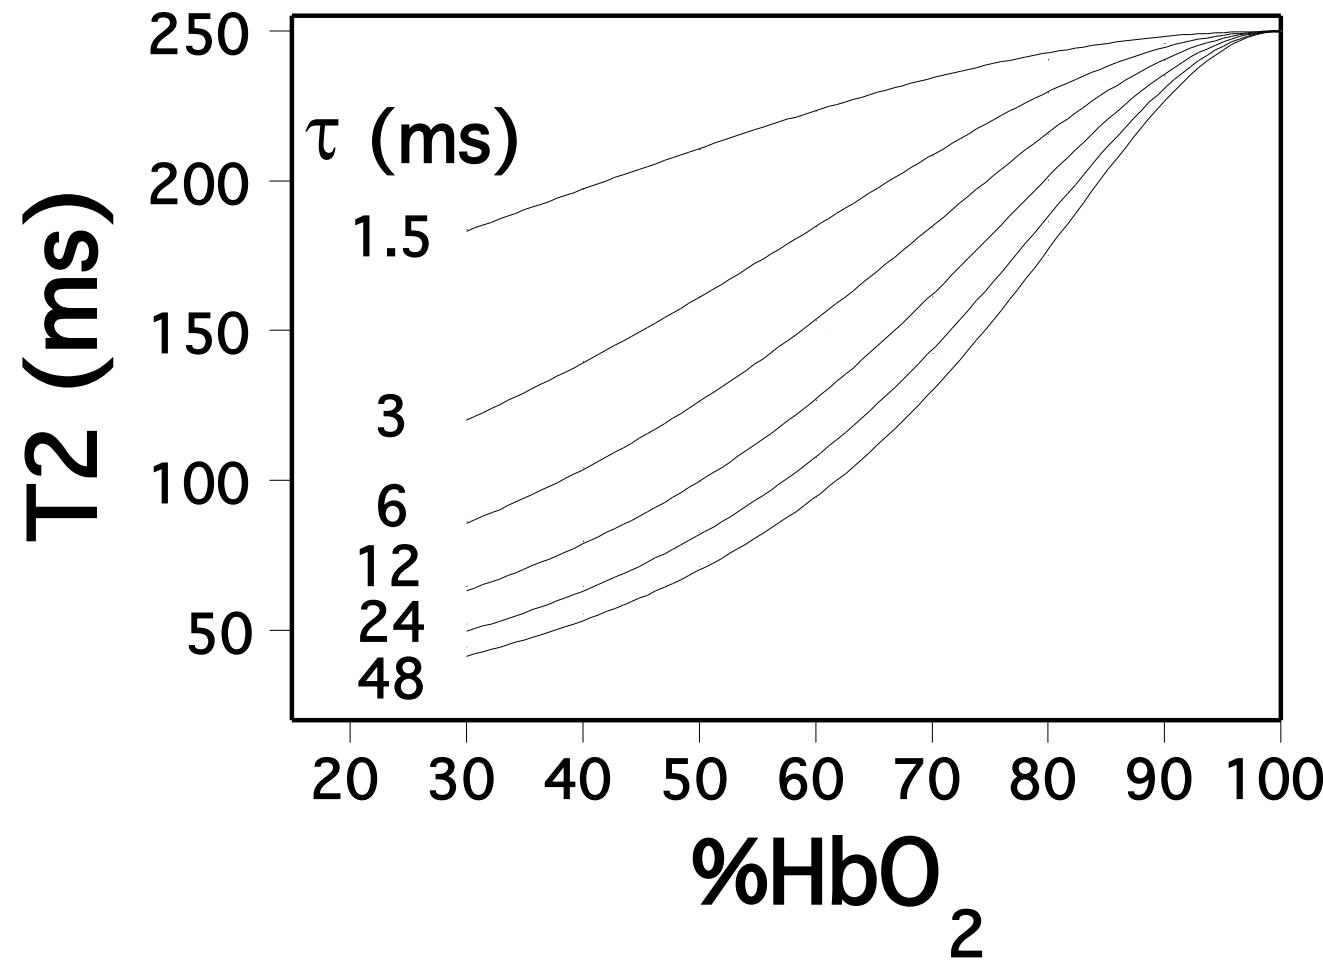

Comparison #1

- Wright et al. JMRI, 1: 275-228, 1991
- Hct = 44
- Field Strength = 1.5 T
- 5 echo measurement
- inter-180 time (τ) from 1.5 ms to 48 ms.
- $T2_o$ set to 250 ms.
- % HbO_2 varied from 30% to 100%

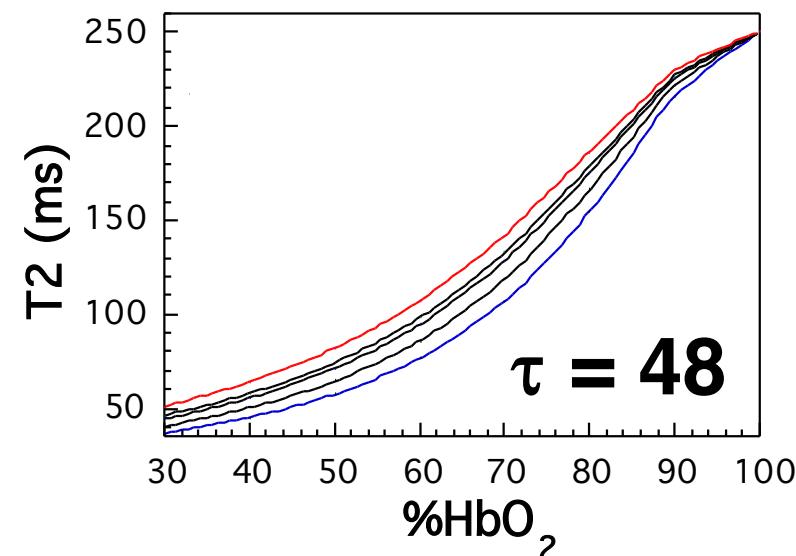

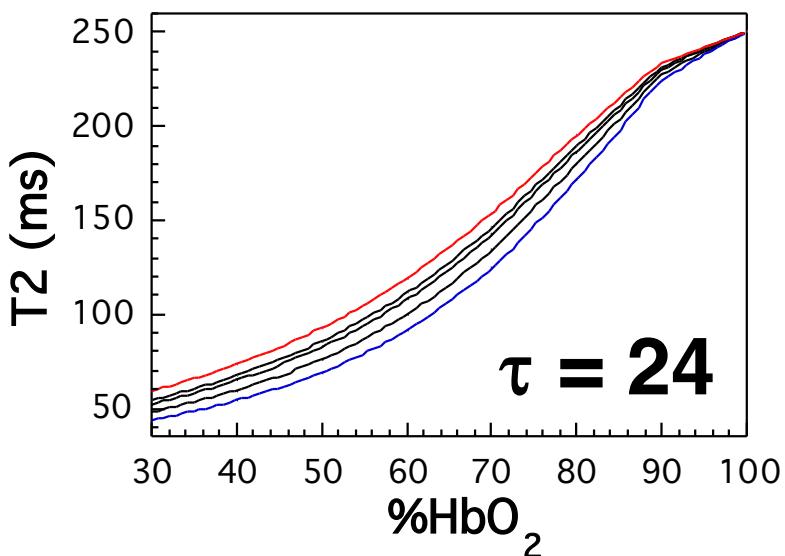

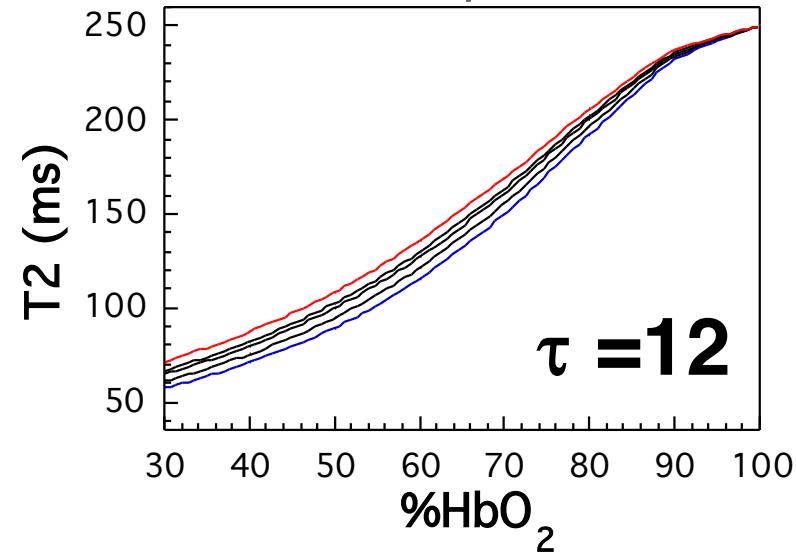

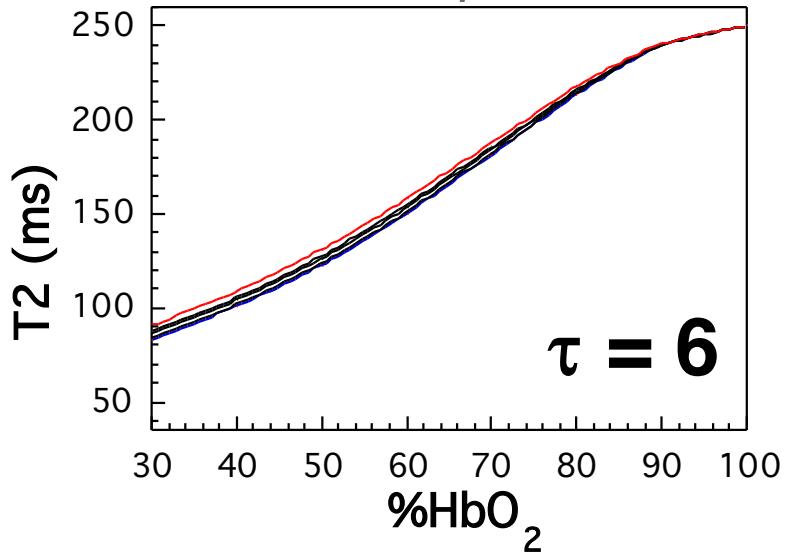

Simulated Multi - Echo Collection

$$D = 1.8 \mu\text{m}^2/\text{ms}$$

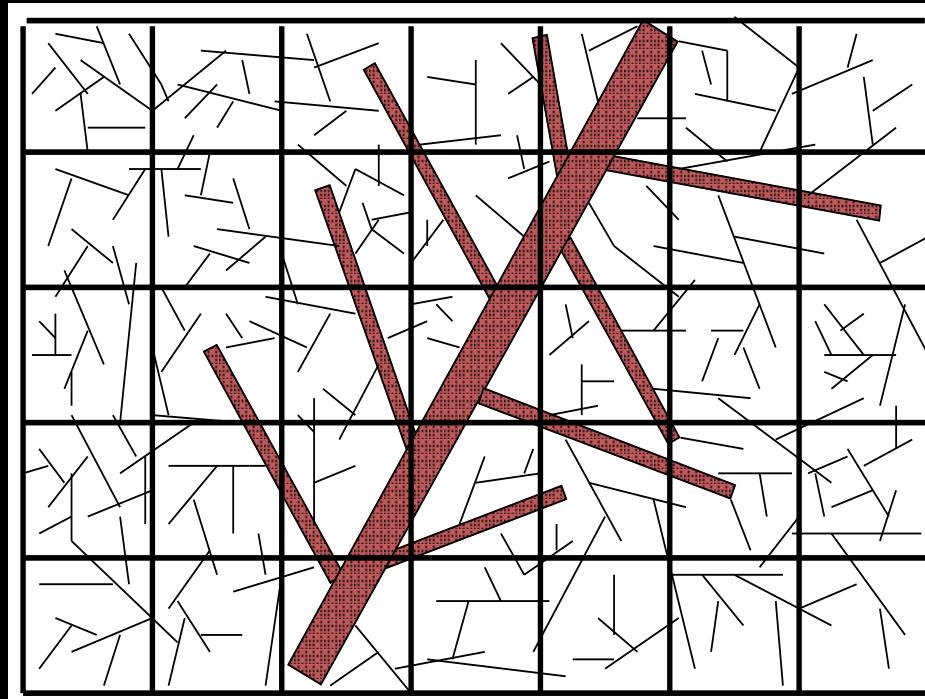

$$D = 1 \mu\text{m}^2 / \text{ms} \rightarrow 2.5 \mu\text{m}^2 / \text{ms}$$

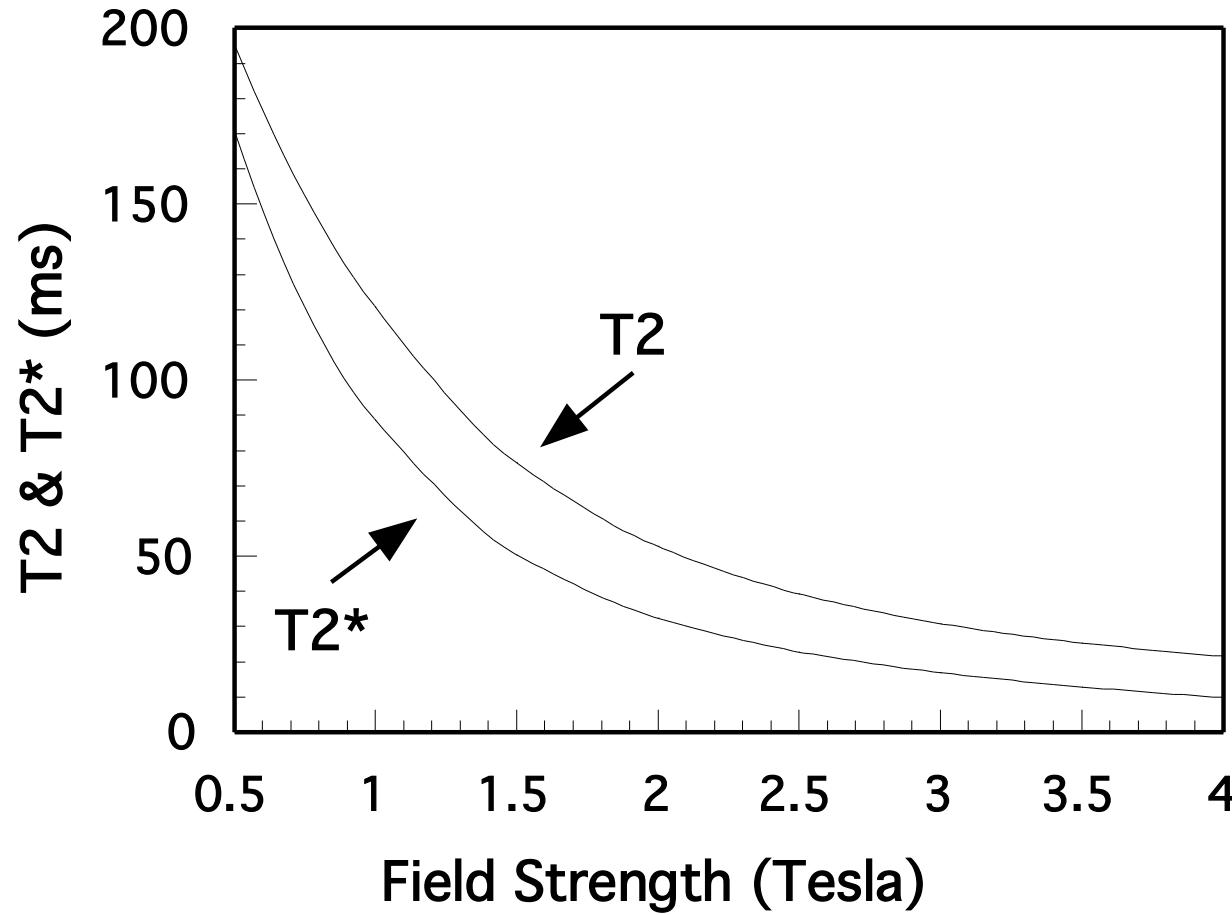

Comparison #2

- Hoppel et al. MRM, 30: 715-723, 1993
- $Hct = 44$
- Field Strength = 1.5 T
- Determine $\Delta R2^*/\Delta R2$
- 5 echo measurement
- Spin-echo: $\tau = 48$ ms.
- Gradient-echo: center echo TE = 48 ms.
- $\Delta R2^*$ and $\Delta R2$ relating
to $\%HbO_2$ change from 60% to 70%.

- Large vessel effect not removed by spin-echo.
- fMRI signal change magnitude (for SE and GE) is likely to be most strongly weighted by blood volume in each voxel

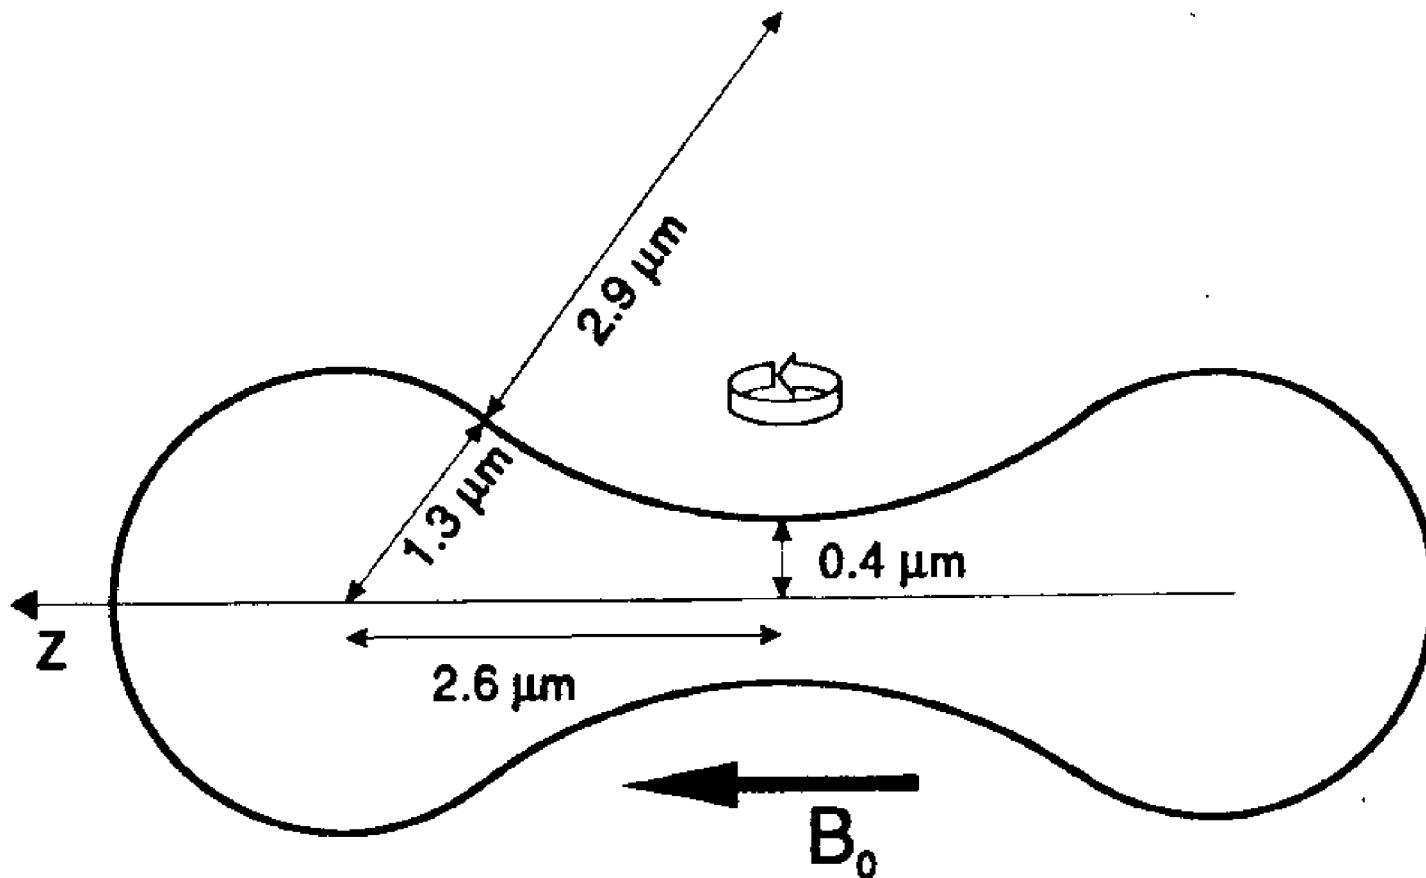

Hct = 44, %HbO₂ = 60, tau = 48 ms

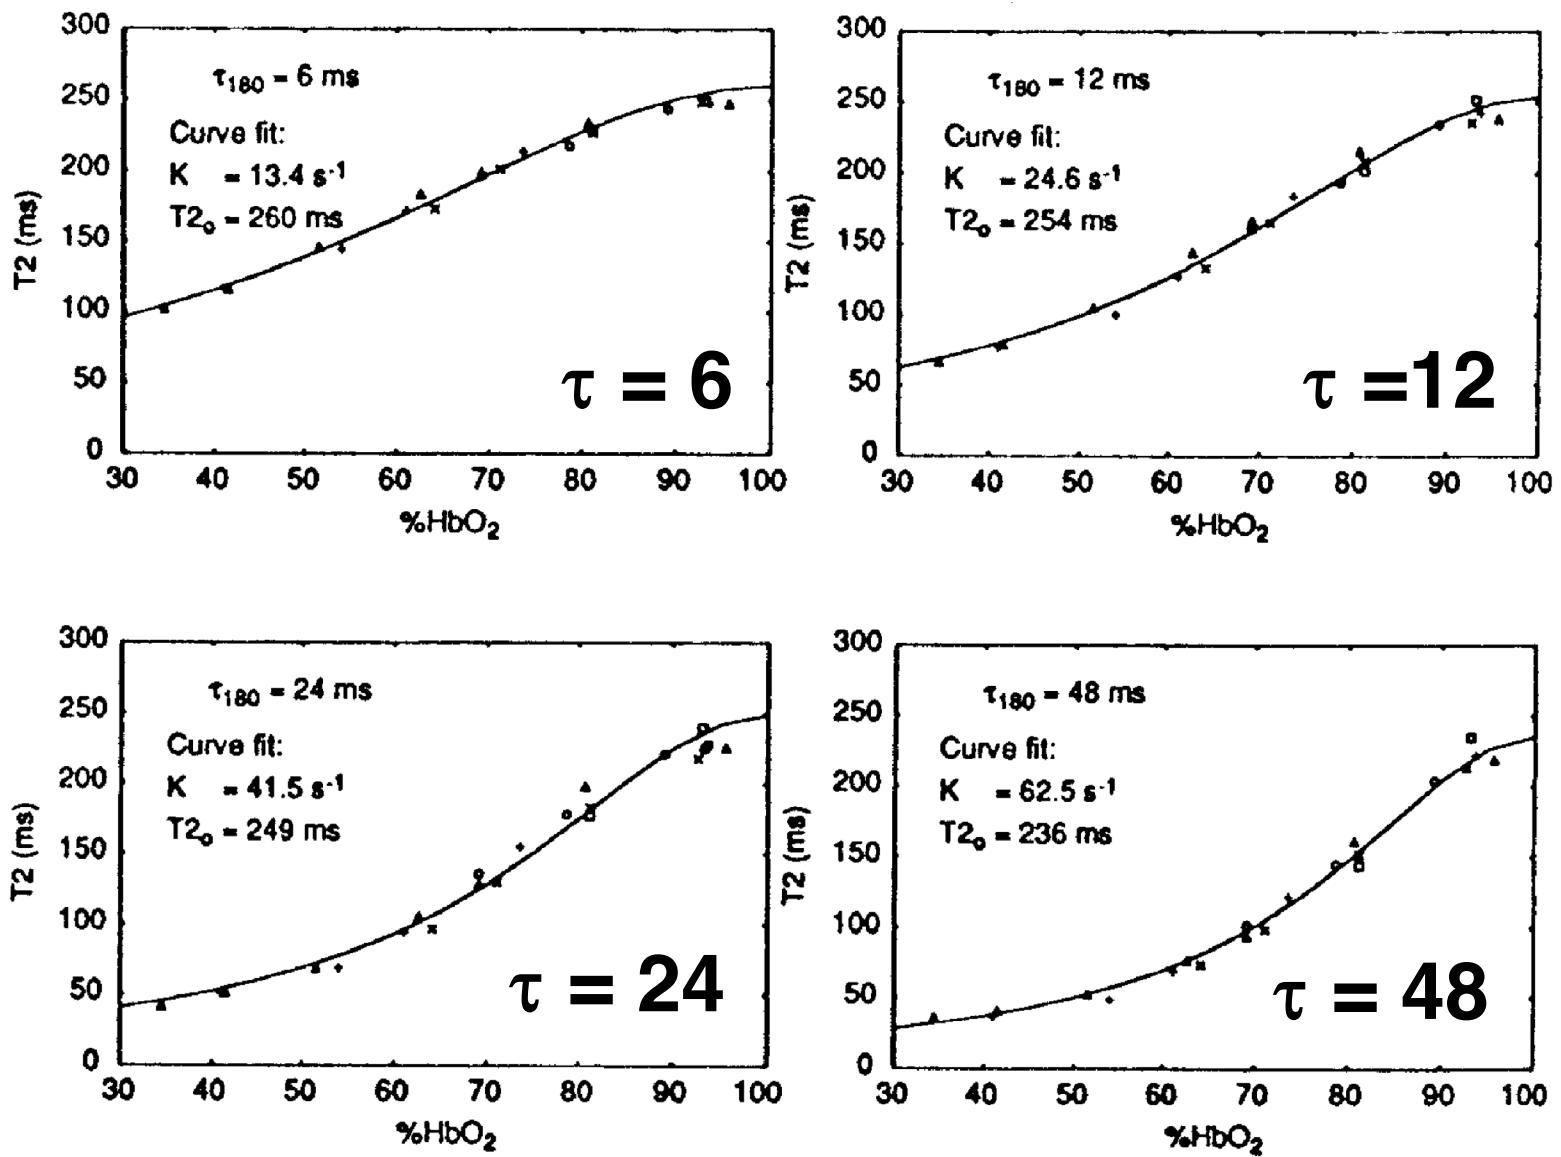

Conclusions

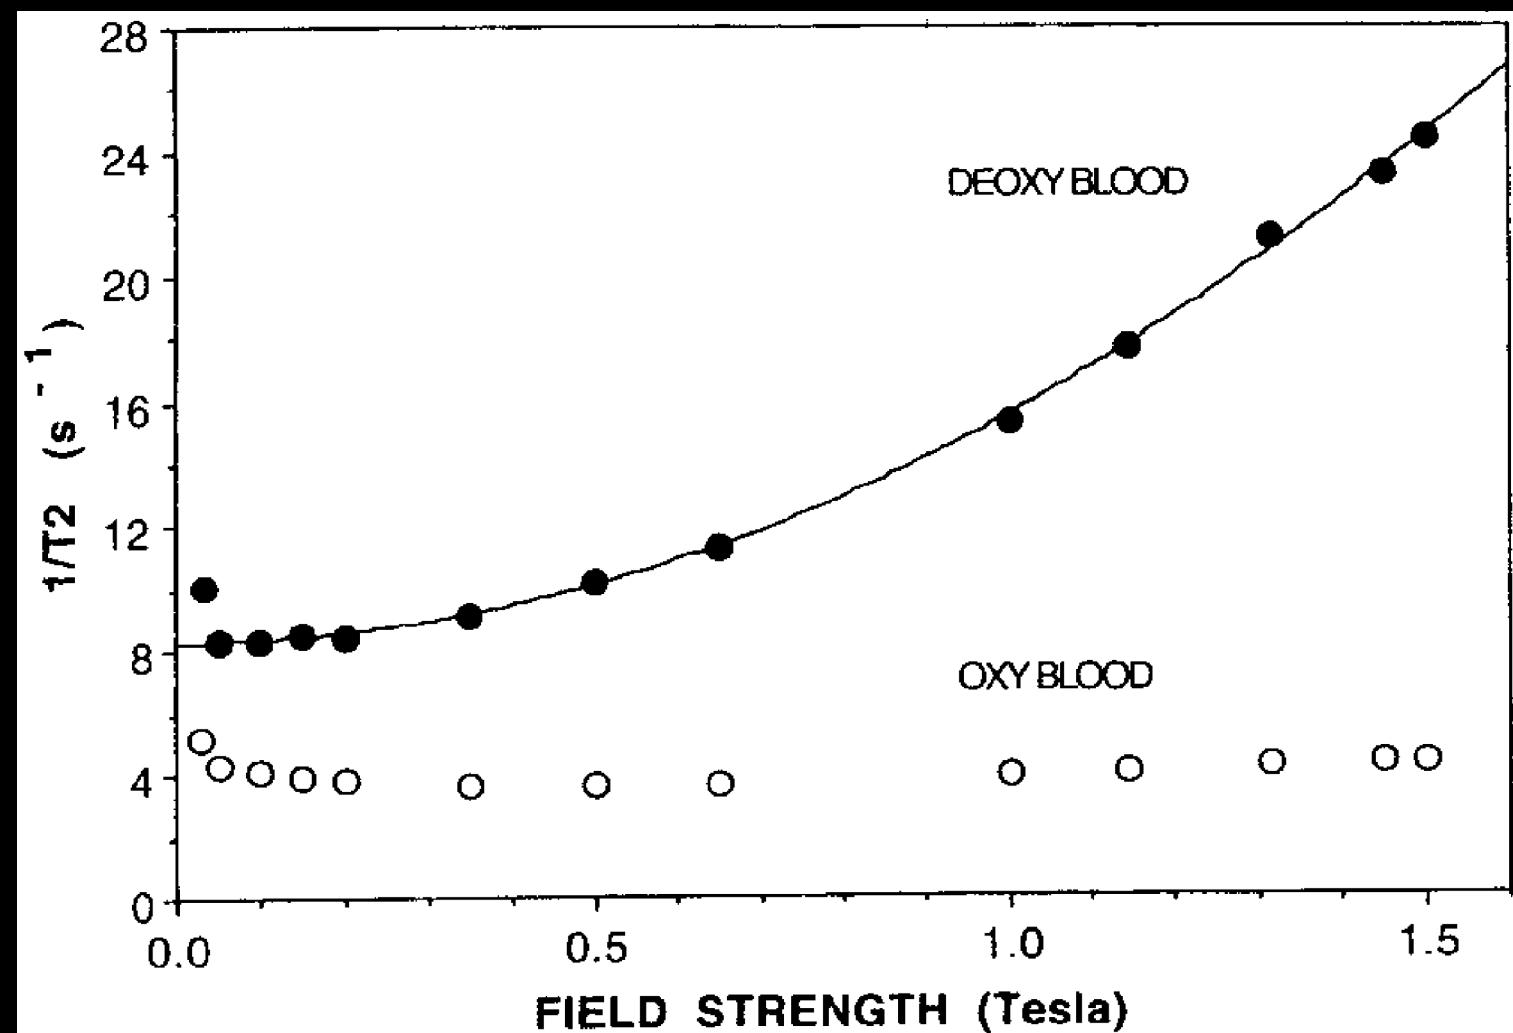

- 1. Intravascular T2* and T2 effects are simulated with a deterministic diffusion model.**
 - simplified geometry and proton dynamics.
 - simplified dephasing mechanism:
(diffusion in, through, and around red blood cells)
- 2. Results show general agreement with literature at D = 1.8 $\mu\text{m}^2/\text{ms}$ and radius = 2.5 μm .**
- 3. Because of intravascular effects, spin-echo sequences do not remove large vessel effects.**
- 4. T2* of blood is significant when considering field strength fMRI dependence.**

Red Blood Cell

Gilles et al. MRM 33: 93-100, 1995

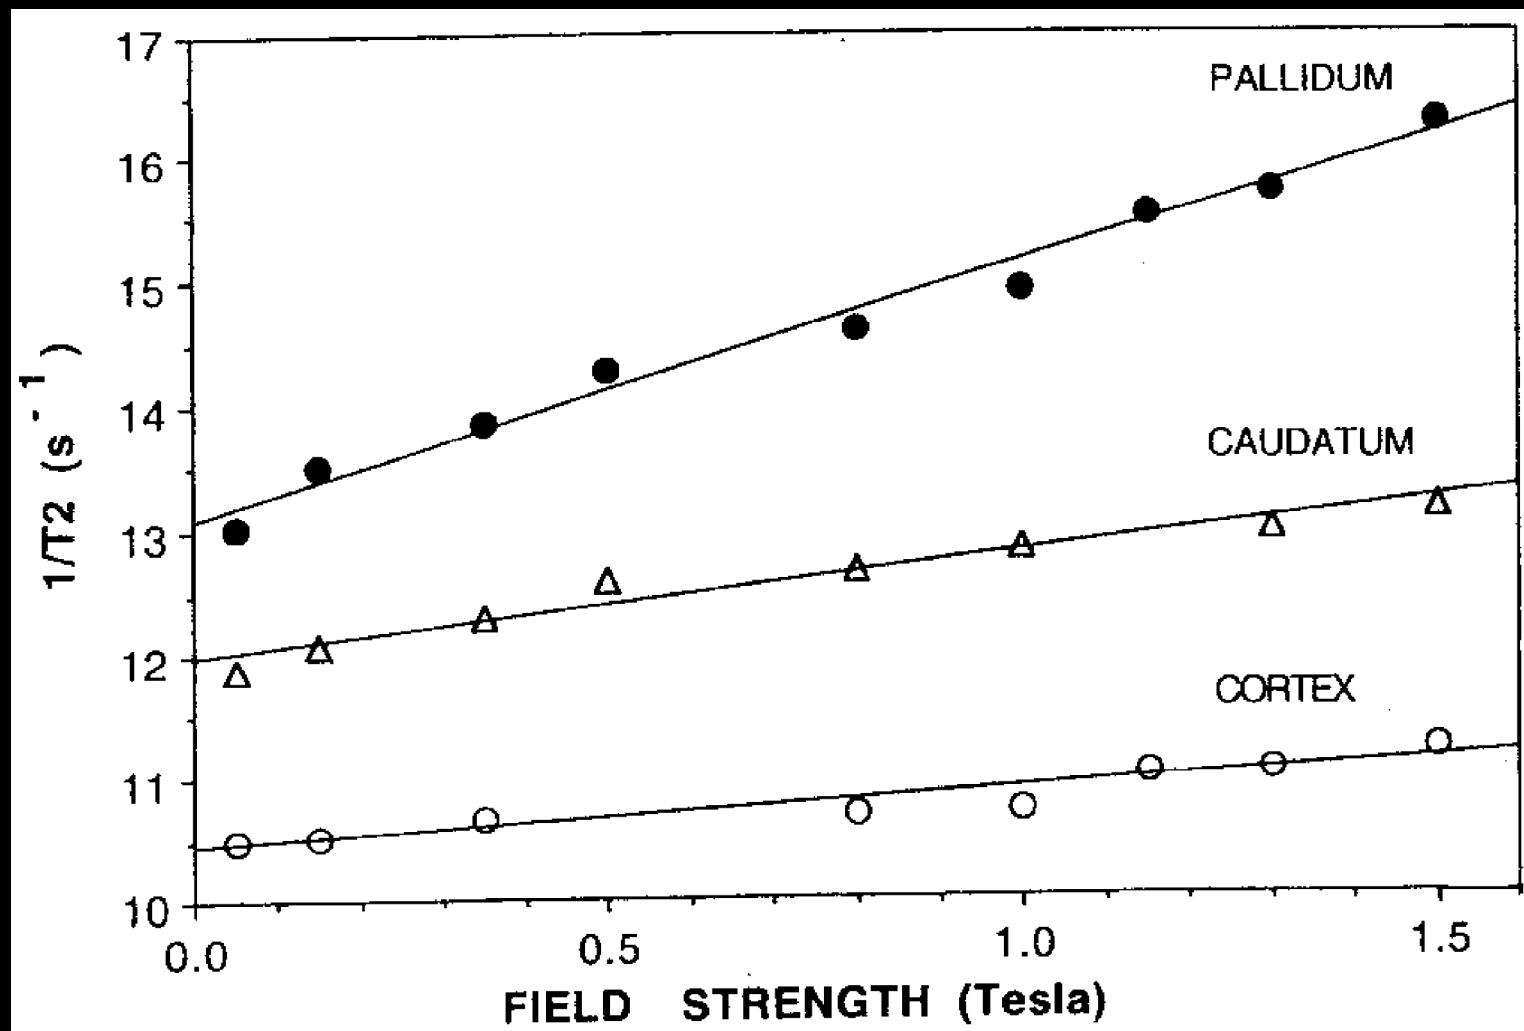

Brooks et al. JMRI 4: 446-450, 1995

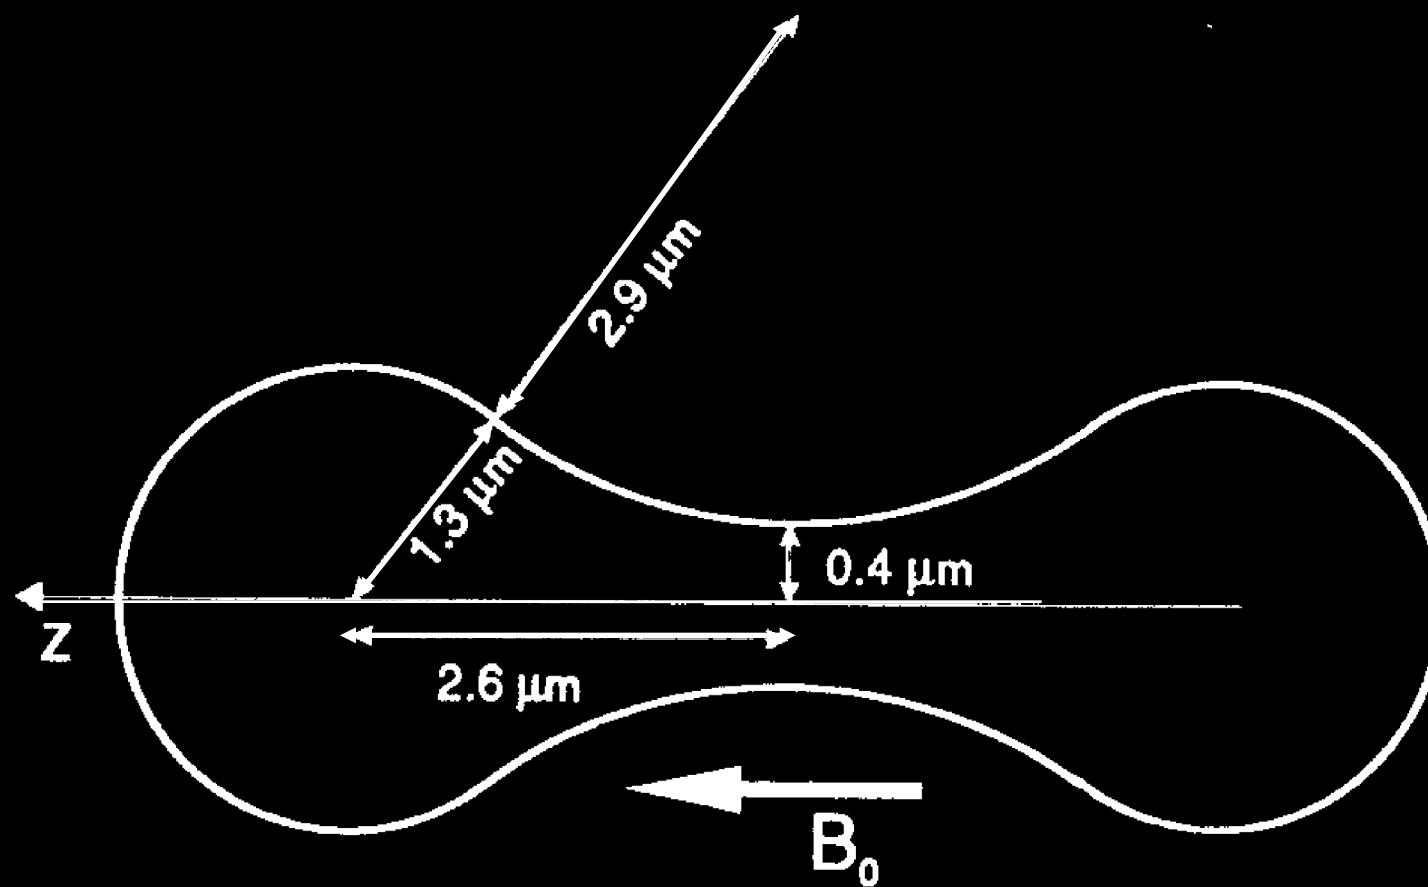

Future Work

- **Model the relative intravascular and extravascular effects using the deterministic diffusion model.**
- **Characterize the differences between exchange and diffusion mechanisms.**

Brooks et al. JMRI 4: 446-450, 1995

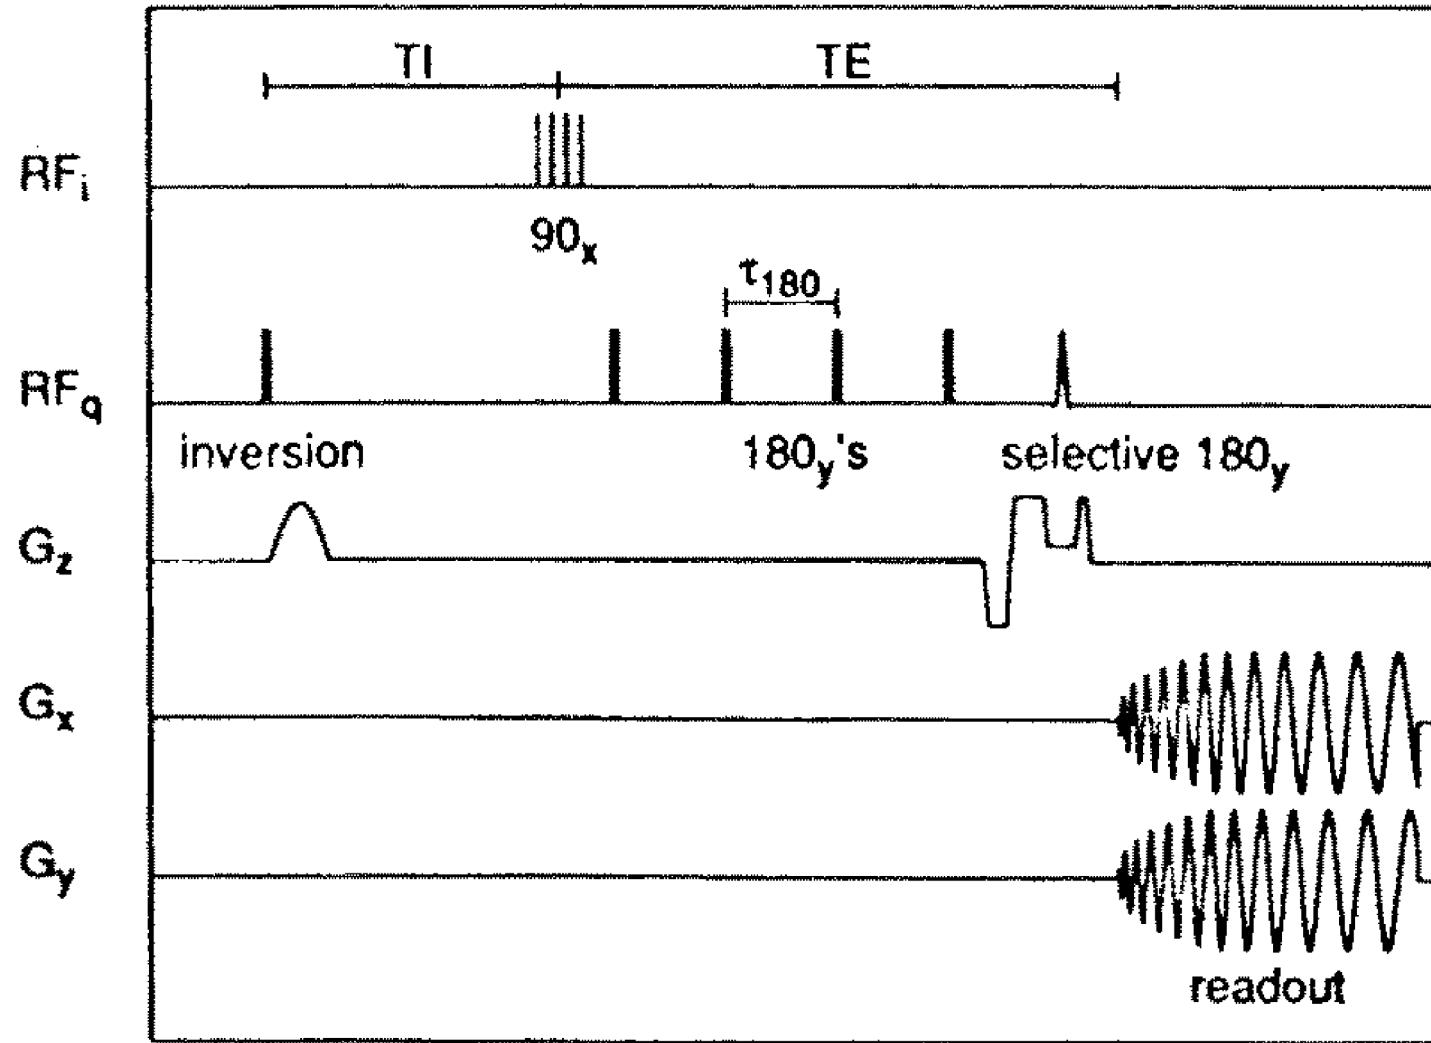

Red Blood Cell

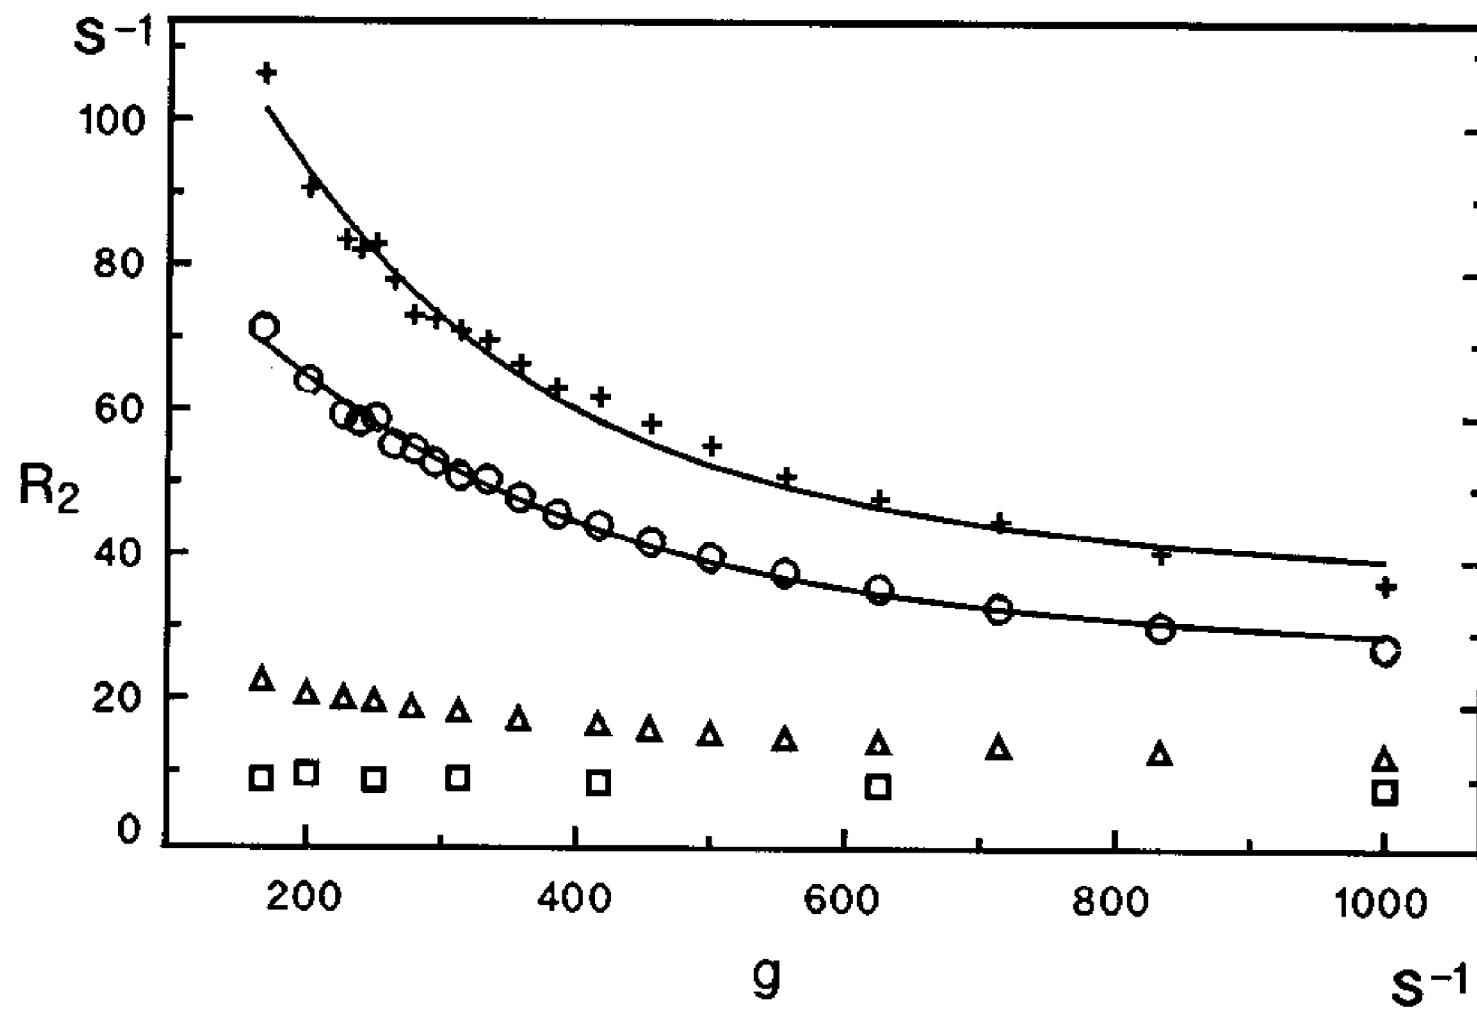

Gilles et al. MRM 33: 93-100, 1995

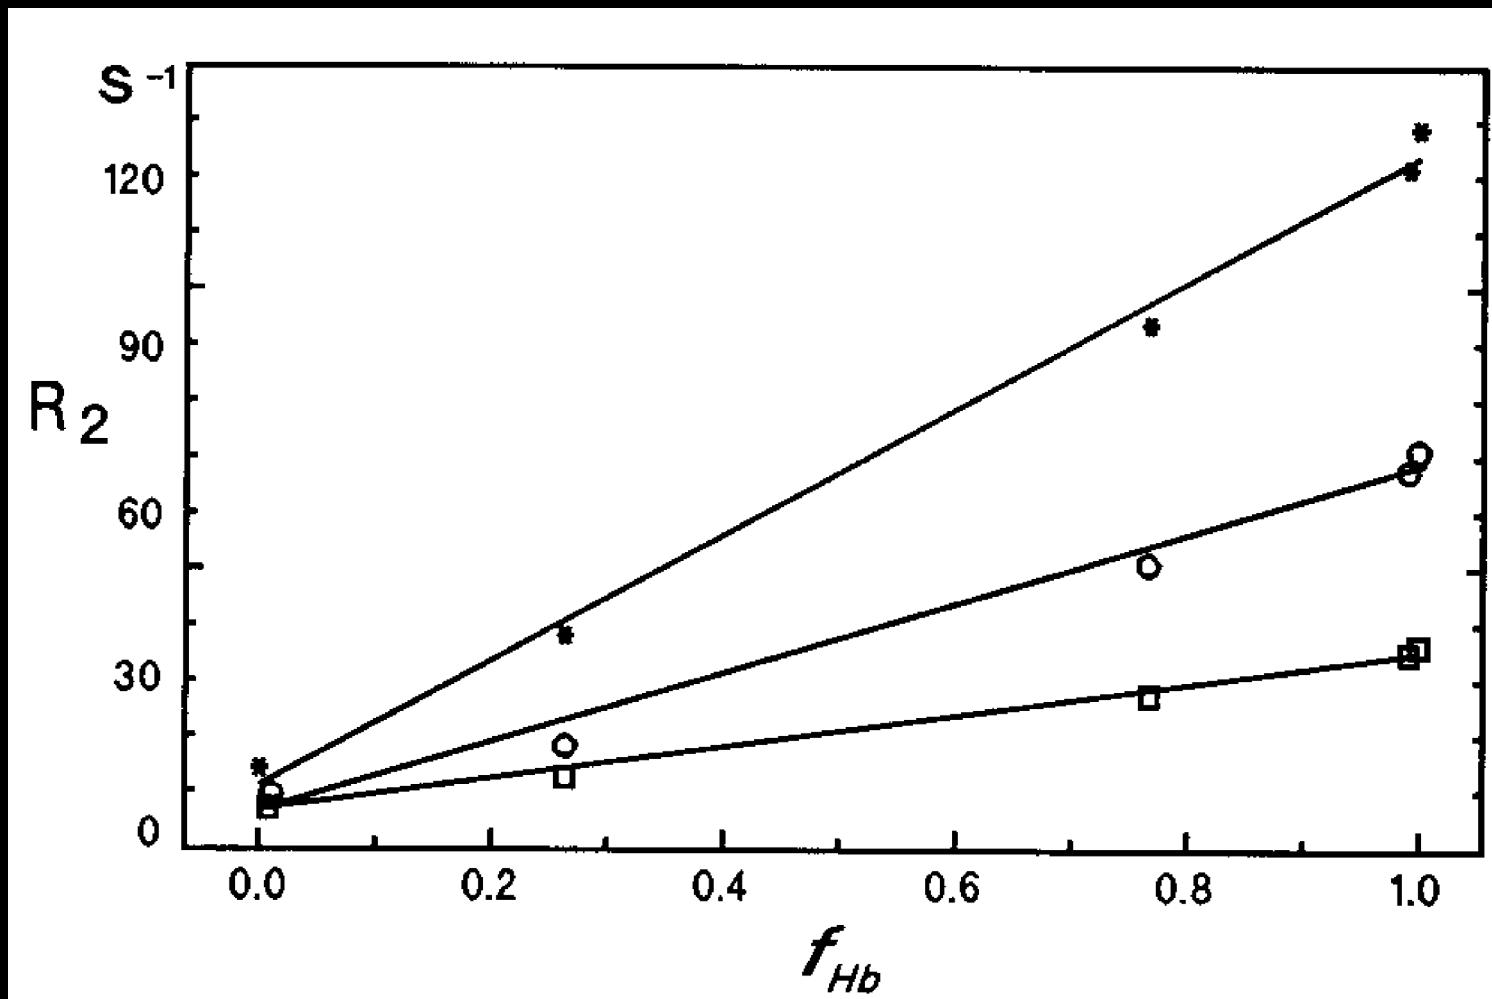

$$\frac{1}{T2_b} = \frac{1}{T2_o} + K(r_{180}, \omega_0) \left(1 - \frac{\% \text{HbO}_2}{100\%} \right)^2$$

Conclusions

- Responses to short duration stimuli are larger than predicted from a linear system
- Spatial variation in this nonlinear relationship is seen
- The variation in nonlinearity is not significantly correlated with magnitude or latency

Implications

- Nonlinearity is primarily neuronal in origin

or

- Magnitude and latency do not accurately reflect underlying vasculature
