**What is the current state of technology of brain imaging?**

**How have these technologies been used to date?**

**How will the advent of more reliable brain imaging technologies benefit society?**

**Are current neuro-imaging technologies powerful enough to predict social behavior?**

- a. If not, how far are we from being able to use neuro-imaging as a predictor of social/ethical behavior?
- b. If so, is it socially acceptable to use it for determining social and/or ethical behavior.

# Current Uses of fMRI

## Understanding normal brain organization and changes

- networks involved with specific tasks (low to high level processing)
- changes over time (seconds to years)
- correlates of behavior (response accuracy, performance changes...)

## Clinical research

- correlates of specifically activated networks to clinical populations
- presurgical mapping
- epileptic foci mapping
- drug effects

## Potential uses of fMRI

### *Complementary* use for clinical diagnosis

- utilization of clinical research results

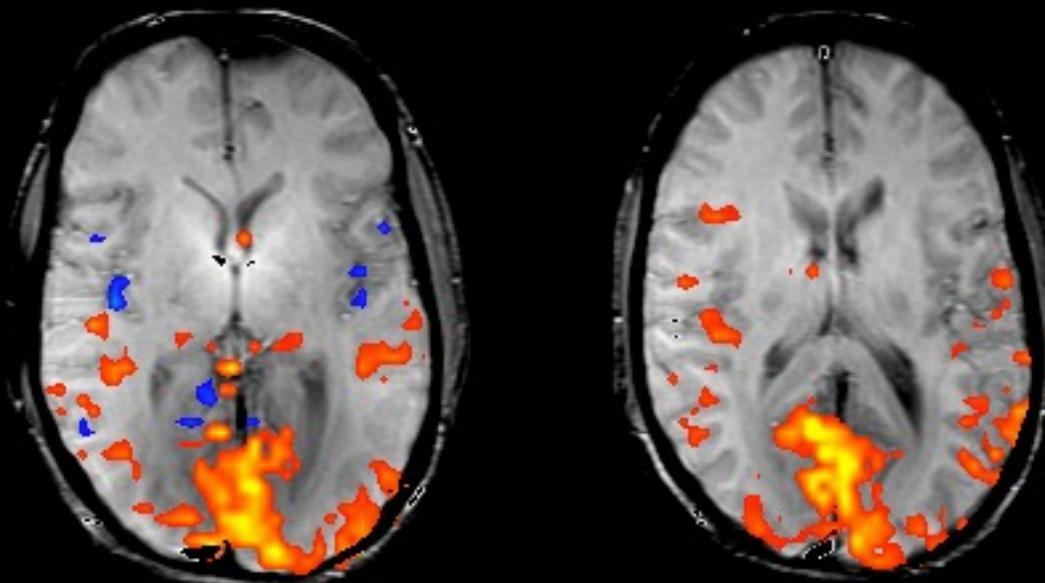

### Clinical treatment and assessment

- drug, therapy, rehabilitation, biofeedback

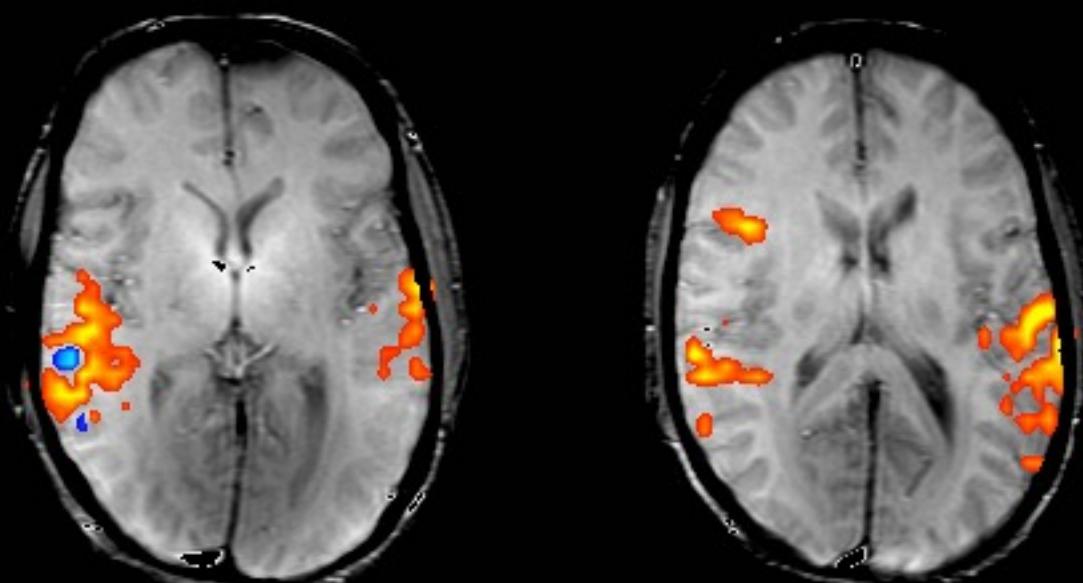

### Non clinical uses

- complementary use with behavioral results
- lie detection
- prediction of behavior tendencies (many contexts)
- brain/computer interface

# Sources of Variability in fMRI

- Signal to noise (about 2/1)
- Hemodynamic response variability  
(many influences on this)
- Motion
- Differences in structural anatomy
- Differences in strategy for task  
(tasks are complicated)

...all of these make fMRI studies to predict or categorize individuals highly problematic

**What is the current state of technology of brain imaging?**

**How have these technologies been used to date?**

**How will the advent of more reliable brain imaging technologies benefit society?**

**Are current neuro-imaging technologies powerful enough to predict social behavior?**

- a. If not, how far are we from being able to use neuro-imaging as a predictor of social/ethical behavior?
- b. If so, is it socially acceptable to use if for determining social and/or ethical behavior.

## Benefits to Society

- better understand biological basis of behavior and performance
- better understand basis of changes with development, aging, learning
- aid in clinical diagnosis and guide treatment
- aid in behavioral/performance assessment and prediction

**What is the current state of technology of brain imaging?**

**How have these technologies been used to date?**

**How will the advent of more reliable brain imaging technologies benefit society?**

**Are current neuro-imaging technologies powerful enough to predict social behavior?**

- a. If not, how far are we from being able to use neuro-imaging as a predictor of social/ethical behavior?**
- b. If so, is it socially acceptable to use it for determining social and/or ethical behavior.**

Are current neuro-imaging technologies powerful enough to predict social behavior?

-not enough data yet... as of now, no.

a. If not, how far are we from being able to use neuro-imaging as a predictor of social/ethical behavior?

-hard to say.. Data are highly multi-dimensional. Social behavior is complicated. To draw inferences about individuals, one must do an exhaustive characterization of sources of variability and develop an algorithm for robustly classifying this multidimensional data.

b. If so, is it socially acceptable to use it for determining social and/or ethical behavior.

-the data are easily over-interpreted...this is the primary problem with this avenue. If prediction is above a threshold of reliability (extensively tested), then it would fall in the same category as reliable behavioral or physical tests and the same rules for usage would apply.

-A stringent policy establishing quality of data and interpretation is absolutely necessary if such applications ever become feasible.
